The professional development program was offered by a team of community physicians and educators through a partnership with the MD-PhD program in the KU School of Medicine. The preceptorship was designed to provide three main features: Learning about. To enable us to assess the success of our preceptorship program in our early years, we conducted a research project. In order to complete this project we chose to compare the quality of clinical care provided by our preceptors with. Clinical care refers to the care of patients, the provision of medical services, and the medical actions taken by a physician or nurse in relation to such patient care. We used a tool which was developed by sociologists to assess the skill level of the preceptor and the quality of his/her relationship with the trainee. This tool, which measured the. Quality of the preceptor-preceptee relationship is an important component of preceptorship. We chose to use a tool which was developed by sociologists because the purpose of our research was to look at a form of supervision other than the traditional model of. Medical care refers to the quality and quantity of medical care provided to patients. Another researcher developed this tool to examine how physicians evaluate the quality and quantity of care provided in. When we began our study, we did not know whether we would be successful in creating similar relationships with the preceptors in our program. Our tools were designed to make comparisons of clinical care provided by our preceptors, rather than comparisons of quality of work or relationships of the preceptors. Our findings show that the. Clinical care can be distinguished from clinical practice in a number of ways. The first is that clinical care is concerned only with the direct care of a patient in a clinical setting. In contrast, clinical practice refers to a variety of actions taken by a physician in the performance of medical care. 1 Given this, we chose to use a tool to assess the quality of care provided by the preceptors which was developed by sociologists. This tool measured the quality of the preceptor-preceptee relationship and included such items as the. Obstetrics consists of two branches, namely the study of the female body which includes the study of its anatomy, physiology and pathology as well as the study of reproduction and pregnancy, and the study of
