www.facebook.com/photo.php?fbid=101518133348476&set=a. Google has been working with researchers to develop technology that can create a virtual autopsy. Google Insights for Search on Wednesday announced that it will feature a new tool that allows researchers to compare data points through Google Analytics, Google AdWords and Google Search, allowing them to create a virtual “autopsy” of their business performance. “With this release, Google can help more people discover, compare, and link the data points they need to make more informed decisions,” Google said in the announcement. Google Insights for Search is a product built on machine learning techniques that enables marketers and business owners to connect the dots between data points within Google’s other products and Google Analytics. Google Insights for Search allows business owners to create segments and compare key performance indicators across different cross-channel metrics using the tools that they are already familiar with. With Google Ads, businesses can analyze search term, cost-per-click, the clicks and impressions, along with the performance on websites, and even the performance of other ad campaigns. With Google Search, users can analyze search terms, clicks and impressions, along with the performance of specific searches. Google Insights for Search enables users to create segments to compare metrics over specific time periods, users, channels and locations. Users have the ability to create and compare a range of data points that influence their overall business performance, allowing marketers to choose the data points that most influence their decision making on how to further their business. “Whether you are a local business, a national company or a small startup with just a handful of pages, Google Insights for Search makes it easy to create custom segments so you can quickly see the performance of your site overall, for your customers in particular geographies, or even for certain keywords that bring customers to your site
