If you don't think the YouTube iFrame re-invention makes life easier for content creators, you haven't been paying attention to the debates. It's a simple change that helps bring out the best in the YouTube experience, and so I was curious about how many readers (yes, they're trainers, after all) had had a reaction similar to one I shared a few years ago. To understand the power of the browser update, it's helpful to understand the past. The version of YouTube I've been using is the old browser-only embeds from the x.video player. If you don't know what I'm talking about, you will. That means that the vjs.js file has been hard-coded inside the HTML iFrame. If you go to the web address (www.youtube.com/embed/BAiBc9BsR01?autoplay=1), the old browser embed will immediately begin playing. The problem, for example, is that there are a lot of devices on the market that have little or no space, or bandwidth. As much as I love Safari anyway, it turns out that the change in YouTube can be pretty disruptive, causing issues ranging from crashing the browser to missing the video and having an overlay that fills the entire screen. Thankfully, that old-school update to 16.0.1 has returned to Lightroom CC. The same update that regular users saw last week that affected the 80 percent of Adobe users who aren't Lightroom CC pros. (I'm not sure I even know why Lightroom CC works this way, other than the fact that we can't do these types of things.) Things get a little bit more complicated in terms of the consumer, however, because many of the newer features on the Photoshop side of the house were the result of collaboration with Apple. Together, they created Photoshop Elements (now called Lightroom). Since the merge with Lightroom, the graphics in typical of Adobe's pattern; crisp, clean, and easy to learn, but you rarely get that "wow" reaction you get with Apple's products. However, if that's what you are looking for, then Elements will do the trick.
