In terms of file format support, Lightroom 5 isn't so bad for the most part. The "Portable Network Graphics (PNG)" and "JPEG 2000" options are still fairly limited, however, and you're still relegated to the file type extensions in use. The best option here is to just save your images in the same formats as every other camera in the world these days. Lightroom has good support for the "RAW" format, but until Photoshop supports BGRA images, you'll have to manually set your color space from within Photoshop. It's not hard, though. Lightroom removes the old "Smart Preview" tool, and in its place has a new "Preview in Lightroom" function that gives you access to the same sort of previews that one of Photoshop's own previews used to do. It's a nice change that I'll miss, as it's easier to use than the old view. Lightroom still lacks the ability to choose what layers are displayed in the top preview panel. This can be a real advantage when working on a large file, as it lets you see old versions in a single panel without having to count through images. Lightroom's "Export" function now offers much more control over the way images are exported than in CS6. It's possible to add multiple devices, including native memory cards, to a single profile, which previously required having multiple profiles. It's also possible to fine tune certain aspects of the export process. The software's export module also uses "context aware" algorithms for exporting different files and collections at once, which is a welcome change. While I would have liked to have a way to directly export my files, Lightroom 5 does offer a batch export feature.
