Field of the Invention This invention relates to an exposed-subject-counting

method and apparatus, and more particularly to an exposed-subject-counting method and apparatus in which the light amount of an image is detected and the amount of light impinging the image is counted. 2. Description of the Prior Art As a count means of measuring the amount of light impinging an image in an image sensing circuit, a solid-state image sensing element such as a CCD (charge coupled device) is used. Since the CCD of the solid-state image sensing element has only a fixed number of light receiving elements, if the solid-state image sensing element is not used in combination with a certain light control device, the amount of light impinging the image cannot be controlled. On the other hand, an exposure control circuit has been developed by the assignee of the present invention in which the light amount of an image is detected in accordance with the amount of light impinging the image and the control of the amount of light impinging the image is performed. The exposure control circuit is comprised of a circuit for detecting the light amount of an image in accordance with the amount of light impinging the image. In the light amount detection circuit, a CCD capable of varying the number of light receiving elements is used. The number of light receiving elements provided in the CCD is varied to change the number of light receiving elements which receive the light impinging the image. The assignee of the present invention has filed a Japanese patent application (Japanese Unexamined Utility Model Publication No. 6-12
